

Health Care Provider Fact Sheet

Disease Name

Glutaric acidemia, type 1

Alternate name(s)

Glutaric aciduria I, Glutaryl-CoA dehydrogenase deficiency

Acronym

GA1, GAI

Disease Classification

Organic Acid Disorder

Variants

Yes

Variant name

Riboflavin responsive GA1

Symptom onset

Infancy (typically 2- 37 months)

Symptoms

Macrocephaly may be present at birth, acute encephalitic-like crises; neurodegenerative disorder with spasticity, dystonia, choreoathetosis, ataxia and dyskinesia, seizures, hypotonia, death due to Reye-like syndrome.

Natural history without treatment

Possible developmental delay due to encephalitis-like crisis; neurologic deterioration including spasticity, dystonic cerebral palsy. May have neurologic signs with normal IQ. Some individuals may be asymptomatic.

Natural history with treatment

If instituted before any damage occurs, normal outcome may occur. Risk for neurologic damage is highest in first few years. Some evidence that treatment may slow neurologic deterioration.

Treatment

Lysine and tryptophan restricted diet, riboflavin supplementation, carnitine supplementation. Rapid treatment of intercurrent illness with intravenous glucose, carnitine and appropriate supportive measures.

Other

Profuse sweating has been reported. Neuroradiographic findings of frontotemporal atrophy on CT or MRI with increased CSF containing spaces in the sylvian fissures and anterior to the temporal lobes. Also decreased attenuation in cerebral white matter on CT and increased signal intensity on MRI. Basal ganglia changes.

Physical phenotype

Macrocephaly, cerebral palsy

Inheritance

Autosomal recessive

General population incidence

1:40,000 in Caucasians and 1:30,000 in Sweden

Ethnic differences

Yes

Population

Old Amish and Ojibway Indians in Canada

Ethnic incidence

1/10 carrier frequency

Enzyme location

Mitochondria; liver, kidney, fibroblasts and leukocytes

Enzyme Function

Metabolizes lysine, hydroxylysine and tryptophan

Missing Enzyme

Glutaryl-CoA dehydrogenase

Metabolite changes

Increased glutaric acid in urine, increased glutaric acid and 3-hydroxyglutaric acid in plasma, 3-hydroxyglutaric and glutaconic acid in urine.

Gene

GCDH

Gene location

19p13.2

DNA testing available

Yes.

DNA testing detail

No common mutations outside of Old Amish (A421V)

Prenatal testing

Enzymen activity in CVS and amniocytes

MS/MS Profile

Elevated C5DC - can be missed some patients
